

CMI Battlecard: Oracle Fusion Cloud ERP

Competing against Oracle Fusion Cloud ERP with SAP S/4HANA Cloud Public Edition

Muhammad Laher

Sep 2025

THE COMPANY

Who are they?

- U.S. multinational technology company; headquartered in Austin, TX.
- Larry Ellison co-founded the company in 1977 & remains executive chairman.
- Total revenue in FY24 of \$53.0 billion, growing at 6% YoY.
- 145 countries globally.
- 160,000+ employees.
- 430k customers, 77 million users – see [customer list](#).
- Oracle claims 10,000+ Fusion Cloud ERP customers.
- Oracle collaborates with over 20k partners, including System Integrators such as Accenture, Deloitte, Kyndryl, PwC, and Sopra Steria. Oracle also partners with Technology providers such as AWS, Microsoft, Google, and Palantir.

GO-TO-MARKET

How they sell?

- Oracle utilizes a mixed business model, which combines subscription-based and traditional sales-based approaches, to sell its software, cloud services, and hardware to customers.
- Oracle caters to businesses of all sizes, government agencies, educational institutions, and resellers, either directly through its sales force or indirectly through the Oracle Partner Network.
- Oracle works with customers to understand their business needs in order to deliver customized software, hardware, or a combination of both.
- Fusion Cloud ERP competes with S/4HANA Cloud Public Edition for midmarket customers, typically those with annual revenue of \$200M and above, while NetSuite targets businesses below this revenue threshold.
- Oracle typically targets its own on-premise customers to upgrade to Fusion Cloud ERP, using a variety of incentives and credits. It also targets SAP installed base customers looking to move to the cloud.

PORTFOLIO

What they sell?

- Oracle sells software, cloud services, maintenance and support services, hardware, and consulting services, divided into the following categories:
 - Oracle Cloud Infrastructure
 - Oracle Cloud Applications
 - Hardware and Software
- Fusion Cloud is Oracle's cloud suite of SaaS applications providing embedded AI and business functions for ERP, SCM, HCM, and CX. (See [this slide](#) for a portfolio overview.)
- Fusion Cloud ERP includes the following features (see [this slide](#) for a product overview):
 - Financial Management
 - Project Management
 - Procurement
 - Risk Management and Compliance
 - Enterprise Performance Management
 - Analytics
- Please refer to [this slide](#) for an overview of Oracle's key investment areas.

FUSION CLOUD ERP

Strengths & weaknesses?

- + **Unified Platform:** Fusion Cloud ERP is built on a unified cloud platform providing a single source of the truth across business processes. Fusion Cloud apps are pre-integrated and share a common data model.
- + **Technology:** Oracle's Cloud Infrastructure provides strong application and data integration, and powers AI-enabled capabilities.
- + **Financial Management:** Oracle's Accounting Hub and the Enterprise Performance Management module provides robust features that are highly rated by market analysts and customers.
- **Implementation:** The complexity and limited pre-configured processes of Fusion Cloud ERP leads to significant adjustments in processes and workflows during implementation, which extend timelines and increases costs.
- **Price:** Customers have reported initial high pricing compared to other vendors, especially midsize organizations.
- **Manufacturing:** Customers with complex requirements will have to consider 3rd party solutions to meet their needs or utilize Oracle's iPaaS capabilities for extensions or integration to partner solutions.

ORACLE PLAYBOOK

How do they compete against SAP?

- Oracle leverages leadership status in Gartner MQs and robust customer reference base to secure contracts.
- Promotes its Fusion Cloud narrative, emphasizing a unified platform that offers customers a single source of truth, while pointing out SAP's inconsistent data models stemming from acquisitions.
- Delivers polished custom demos focused on industry-specific use cases, but fails to clarify the complexities involved in building such tailored applications.
- Presents an anti-SAP website to customers that highlights key differentiators from SAP. See [this slide](#) for an overview of the key claims.
- Employs aggressive sales tactics, including high-pressure environments and substantial discounts, sometimes offering free add-ons or significant reductions for early commitments to outmaneuver SAP.
- See [this slide](#) for the main sales tactics used by Oracle.

INTERNAL – SAP Only

SAP PLAYBOOK

How should we compete against them?

- Position GROW as a comprehensive all-in-one SaaS solution with competitive pricing and rapid deployment.
- Demonstrate the power of the Universal Journal as well as industry-specific capabilities.
- Evangelize the “AI-first, Suite-first” strategy. Suite-first means a unified suite of apps leveraging one domain model to provide consistent data across apps, reducing the need for complex middleware. AI-first means deploying Joule across apps, leveraging embedded AI across apps, and customizing AI apps via the GenAI Hub.
- Demonstrate the value of clean core principles with extensibility options such as low code with SAP Build Apps.
- Present BTP as the foundation for SAP's cloud apps, integrating data management, analytics, app development, and intelligent technologies in a unified environment.
- Point out that SAP's Cloud ERP business is outpacing Oracle's. In Q4 2024, SAP's Cloud ERP Suite revenue increased by 33% year-over-year, while Oracle reported a more modest 12% growth.

CMI Battlecard: Oracle Fusion Cloud ERP

Muhammad Laher

Sep 2025

Competing against Oracle Fusion Cloud ERP with SAP S/4HANA Cloud Public Edition

Why SAP wins

How to differentiate

1 Quick time-to-value

Demonstrate how SAP's pre-configured processes and streamlined implementation offer quick time-to-value by enabling businesses to rapidly adopt standardized processes without extensive customization, minimizing the risks and costs while maximizing operational efficiency and agility.

2 Industry best practices

Demonstrate SAP's 50 years of industry best practices in S/4HANA Cloud in key areas like finance, procurement, supply chain, and manufacturing. Leverage SAP's Industry Cloud solutions to further enhance these best practices by providing industry-specific capabilities in certain white spaces to provide end-to-end business processes.

3 Business Technology Platform (BTP)

Present BTP as a unified foundation for SAP's cloud apps, integrating data management, analytics, application development, and intelligent technologies. This comprehensive platform empowers organizations to drive innovation and enhance operational efficiency. Position SAP as a vendor that can meet the demands of modern enterprises undergoing digital transformation.

4 SAP Business Network

SAP Business Network offers a broad many-to-many network connecting multiple trading partners, enabling extensive collaboration across the value chain of a company and its ecosystem, while Oracle Business Network focuses more on 1:1 direct connections and integration between registered trading partners, limiting its collaborative scope and network effects. This makes SAP Business Network stronger in scale, flexibility, and ecosystem connectivity. Please see [here](#) for the CMI Battlecard for Oracle Procurement Cloud vs SAP Ariba

5 Trust Centre

Highlight the SAP Trust Center as a key differentiator. Emphasize how it provides transparency into SAP's security measures, compliance processes, and data protection policies, ensuring adherence to industry standards like ISO 27001 and GDPR. This helps build trust and confidence in SAP's cloud services, allowing customers to focus on their core business operations while ensuring regulatory compliance. Please see [here](#) for the Trust Centre webpage.

Why Oracle wins

Objection handling – how to counter

1 Cloud-native architecture with a unified data model

Oracle's cloud offerings, including vertical solutions, newly acquired solutions, and legacy on-premise products, lack a unified data model and cohesive architecture. In contrast, S/4HANA Cloud Public Edition features a cloud-native design and a modern architecture, enabling continuous innovation without disruptive upgrades.

2 Suite approach

Oracle Fusion Cloud provides ERP, CRM, HCM, and SCM, offering integrated business capabilities that Oracle believes competitors cannot match. SAP's Business Suite GTM strategy delivers end-to-end processes in the cloud for all lines of business with centralized data and the power of AI agents. Cloud ERP is at the center of SAP's Business Suite, with BTP and Business Data Cloud as the foundation for all cloud applications.

3 Artificial intelligence

Oracle embeds AI in cloud applications at no extra cost, but future price increases are possible to maintain profit margins. SAP uses a consumption-based credit model, allowing users to scale their usage and pay based on value. Oracle promotes ease of use with pre-built models, but SAP's AI Foundation and Generative AI Hub offer flexible customization for tailored AI solutions that leverage large language models to better meet operational needs.

4 Slick demos and presentations

When showcasing S/4HANA Cloud Public Edition, clearly differentiate between pre-built functionalities and configurable elements to counter Oracle's oversimplified demos, which hide complexity. Align demos with the customer's specific business processes and terminology, highlighting industry best practices and intelligent technologies for maximum impact.

5 Pricing

Oracle will undercut SAP on price, often in the later stages of the deal with extremely low prices on licenses and implementation. Position GROW as a comprehensive all-in-one solution with competitive pricing and a rapid deployment in an SaaS model that reduces TCO and enhances ROI. See [this slide](#) for details on Oracle's pricing.

Got what you were looking for?

Go ahead and win your deal!

Oracle | Key Investment Areas

GenAI Integration

AI is now embedded in its solutions at no extra cost or separate SKUs – democratizing access and positioning as a potential differentiator.

- In 2025, Fusion ERP and HCM customers will all move to 23ai, Oracle's autonomous database.
- Introduced 50+ AI agents in Fusion Cloud Applications (September '24), automating finance, project management, and analytics workflows.
- Unveiled 100+ GenAI use cases (September '24), including call center optimization, legal research, revenue intelligence, and recruitment.
- Oracle has committed to quarterly releases of 100+ AI features, primarily based on customer feedback.
- Launched Oracle Fusion Data Intelligence (September '24), an intelligent data lake providing GenAI-powered analytics for ERP, HCM, and SCM.
- Announced Oracle Code Assist (September '24), an AI code companion to help accelerate app development.

CMI Perspective:

Oracle views GenAI as a way to differentiate and increase adoption of its applications, rather than as a direct monetization mechanism. Monetization will happen at the infrastructure level, where Oracle looks to grab share of AI workloads with OCI.

OCI Expansion

OCI strategy aims to position Oracle as a leader in strategic cloud platform services.

- Oracle is aggressively expanding its OCI footprint by building 100 new cloud data centers and expanding 66 existing ones, aiming to have a presence in every country to support businesses globally with low-latency cloud services, ensuring data sovereignty and compliance with local regulations.
- Oracle currently operates 50 public cloud regions across 25 countries, offering a consistent set of over 150 cloud services. The company continues to add new regions to support business continuity and meet data residency requirements, especially in highly regulated industries.
- The main components of Oracle's OCI strategy are security, cloud adoption framework (CAF), and a well-architected framework. Additionally, OCI provides high-performance computing options and advanced AI capabilities.

CMI Perspective:

Through expanding its global autonomous cloud infrastructure to provide more interconnected and resilient cloud services, Oracle is positioning itself as a leader in strategic cloud platform services.

Multi-Cloud

Oracle has reinforced its commitment to open multi-cloud interoperability via partnership with AWS, building upon collaborations with Azure and GCP.

- Oracle Database@AWS is set for GA in 2025. Meanwhile, Oracle Database@Google Cloud has achieved GA and OCI@Azure has surpassed 450 joint customers.
- The expansion includes plans for 31 Microsoft data centers (7 live, 24 planned) and 18 Google data centers (4 live, 14 planned).
- Oracle's multi-cloud strategy allows businesses to leverage the strengths of each platform, ensuring seamless integration and high-performance connectivity across different cloud environments.
- Oracle provides customers with the flexibility to choose the best cloud services for their needs, avoiding vendor lock-in and enabling cost optimization, data residency compliance, and enhanced business agility.

CMI Perspective:

These partnerships position Oracle to drive significant acceleration in cloud migration, unlocking potential to transition more of its \$14B on-premises infrastructure support base to the cloud, with up to 5x ARR uplift, as well as driving increasing adoption of Autonomous Database.

Oracle | Primary Claims against SAP and How to Rebut Them

Cloud-native architecture

Oracle asserts that SAP utilizes a hybrid cloud model, incorporating features from older architecture.

S/4HANA Cloud is built with cloud-native features and a modern cloud architecture, enabling continuous innovations without disruptive upgrades.

Unified data model

Oracle states SAP has inconsistent data models from acquisitions, causing siloed data and integration issues.

SAP is enhancing its data models with the Virtual Data Model, One Domain Model, and Datasphere, which provides a consistent data environment and improves interoperability.

Suite approach

Oracle asserts that SAP's various ERP applications complicate cloud transitions and limit scalability.

RISE with SAP and GROW with SAP offer customers various pathways for business transformation that align with their operational needs, providing flexibility and scalability.

Deployment

Oracle claims SAP's deployment is complex due to reliance on integrating legacy systems and multiple cloud apps.

SAP's Integration Suite provides prebuilt integrations, APIs, and connectors that simplify the integration process and reduce costs related to custom development.

Faster than SAP

Oracle claims financial close of its own books in less than 10 days, 2x faster than SAP.

The Universal Journal enables continuous, real-time financial insights, while SAP Advanced Financial Closing (AFC) enhances automation, compliance, and transparency, potentially reducing closing times by up to 80%.

Artificial intelligence

Oracle states that SAP shares data from AI models with customers and charges extra for AI services.

SAP requires customer consent for AI data usage to comply with GDPR and protect PII. SAP offers a consumption-based credit model that allows customers to pay based on the value derived from AI apps.

For detailed responses and rebuttals to Oracle's claims, please see [here](#)

Oracle | Sales Tactics Used against SAP

Sales tactic	What Oracle positions	The reality and how to defend
Relies heavily on Finance capabilities	Oracle targets finance professionals with events, collateral, and informal gatherings. Oracle's main sales play is to lead with finance and positions itself as a finance thought leader.	SAP has a 40-year history in financial software and understands CFOs better than any other vendor in this space. SAP offers a comprehensive suite of financial management solutions that includes financial planning and analysis, accounting, tax management, treasury management, and more. Demonstrate the power of the Universal Journal. Highlight that Oracle does not have deep Treasury Management capabilities. Include Finance Managers/CIO when giving presentations and product demos, not just IT.
Creates fear, uncertainty, and doubt (FUD)	Oracle points customers and prospects to its anti-SAP webpage, which includes blogs, infographics, surveys, and reports, all aimed at generating FUD.	Please see the detailed rebuttal document here .
Offers heavy discounts	Oracle will attempt to snatch the deal by offering a variety of discounts, including "free" cloud licenses during the transition period. Some of the special deals include "free" access to Oracle PaaS and/or Oracle autonomous database via universal credits. Oracle will tell customers that SAP charges for Digital Access and bank connectivity.	Highlight to customers that they will be hit with large price increases when the free credits expire. Position GROW with Digital Access bundled into the offering. Emphasize that SAP charges for MBC (that automates the process), while Oracle leaves the bank connection for the customer to figure out.
Promotes ease of implementation	Oracle presents Fusion Cloud ERP as the "easy migration choice" for existing Oracle users and often touts its SOAR program, which is a loose set of best practices to move its customers to the cloud. Oracle will tell customers that SAP's best practices do not allow for tailoring to meet unique requirements.	Oracle does not have a set methodology, but rather a set of guidelines. Highlight to customers that their best practices are for base level processes shared within the industry and the value-added processes are added on top. Position SAP's Activate methodology, Cloud ALM, and CBC for ease of implementation. Position SAP's preconfigured best practices for every scope item for quick time-to-value.
Positions Cloud@Customer and Dedicated Cloud as cloud	Oracle positions "Cloud@Customer" and Dedicated Cloud as a traditional cloud set up.	Oracle's Cloud@Customer and Dedicated Cloud offerings provide cloud services, but are delivered in an on-premises environment. While this approach does provide the benefits of cloud computing with scalability and flexibility, it leverages the on-premise infrastructure, making these offerings more like an on-premise deployment rather than a cloud deployment.
Portrays Oracle Fusion Cloud ERP as the simple choice for on-premise customers	Oracle positions Fusion Cloud ERP as the simple choice with one product, one cloud, and one interface. Oracle will highlight that S/4HANA Cloud is a hybrid cloud incorporating features from older architecture and a cloud with different platforms due to many acquired products.	S/4HANA Cloud is built with cloud-native features and a modern cloud architecture, enabling continuous innovations without disruptive upgrades. Point out Oracle's own jumble of acquired products.

Suite Overview | Oracle Fusion Cloud Applications

Fusion Cloud Applications	ERP	SCM	HCM	CX	Data Intelligence
- Fusion Cloud is a complete cloud suite of SaaS applications providing the core business functions across ERP, SCM, HCM, and CX. - AI is embedded into Fusion Cloud Applications for automating business processes. - Fusion Cloud Applications run on Oracle Cloud Infrastructure. - The Redwood Design System provides a modern User Experience, which allows users to extend applications or build their own. - A connected customer community offers proactive support and expert guidance. - Deep integrations between applications, as well as a common data source, ensure a single source of the truth. Fusion Cloud is Oracle’s equivalent to SAP’s Business Suite.	Financial Management	Supply Chain Planning	Human Resources	Marketing	Fusion ERP Analytics
	Procurement	Inventory Management	Talent Management	Sales	Fusion SCM Analytics
	Risk Management and Compliance	Manufacturing	Workforce Management	Service	Fusion HCM Analytics
	Enterprise Performance Management	Maintenance	Payroll	Industry Solutions	Fusion CX Analytics
	Project Management	Product Lifecycle Management	Oracle ME		
		Order Management			
		Logistics			
		Procurement			
		Data Intelligence			
		Sustainability			

ERP Product Overview | Oracle Fusion Cloud ERP

Financial Management	Project Management	Procurement	Risk Management and Compliance	Enterprise Performance Management (EPM)	ERP Analytics
Accounting Hub	Plan, Schedule, and Forecast	Supplier Management	ERP Role and Security Design	Planning	KPI Management
Reporting and Analytics	Resource Management	Supplier Portal	Separation-of-Duties Automation	Profitability and Cost Management	Best Practice Metrics Library
Payables and Assets	Cost Management and Control	Sourcing	Continuous Access Monitoring	Account Reconciliation	Prebuilt Analytic Models
Revenue Management	Billing and Revenue Management	Procurement Contracts	User Access Certification	Financial Consolidation and Close	Extensible Architecture
Receivables	Grant Management	Self-Service Procurement	Configuration Controls	Tax Reporting	Business Content Areas
Collections	Project Asset Management	Purchasing	Transactions Control	Narrative Reporting	Self-Service Data Discovery
Expense Management		Payables	Audit and SOX/ICFR Workflows	Enterprise Data Management (EDM)	Augmented Analytics
Joint Venture Management		Procurement Analytics	Enterprise Risk Management (ERM)		Collaboration and Publishing
U.S. Federal Financials			Business Continuity Planning		Enterprise Architecture and Security
					Mobile Exploration

- Fusion Cloud ERP is a comprehensive, cloud-based ERP solution that integrates all lines of business (listed above) into a unified platform.
- The solution leverages advanced technologies like AI and ML to automate processes, enhance decision-making, and improve operational efficiency.
- Fusion Cloud ERP offers flexible deployment options, including Public Cloud (the default), Private Cloud, Hybrid Cloud, and Sovereign Cloud.
- Oracle provides new innovations on a quarterly basis and integration capabilities to other Oracle products and 3rd party systems.
- **Fusion Cloud ERP is Oracle's equivalent to SAP S/4HANA Cloud.**

Oracle Fusion Cloud ERP Strengths & Weaknesses | Finance & Spend (1 of 3)

Strengths	Weaknesses
▪ Robust Capabilities: Fusion Cloud ERP demonstrates advanced capabilities for financial management, human and third-party resource management, project management, procurement, extended planning and analysis (xP&A), and order-to-cash (O2C) processes. ▪ Embedded AI: Oracle is embedding AI and generative AI across a wide range of use cases for Fusion Cloud ERP. These embedded AI features do not incur additional licensing fees for Fusion users. ▪ Record Capabilities: Fusion Cloud ERP is capable of handling record management and serving as the central accounting book of record. This capability ensures that financial data is accurately maintained and easily accessible. ▪ Smart Views: Fusion Cloud ERP uses an interactive Excel spreadsheet interface for viewing/changes for AP and AR. ▪ Financial Consolidation and Close: Via EPM Cloud, FI consolidation and close is integrated into Fusion Cloud ERP, although data must go through an integration process. EPM Cloud also includes tax reporting and account reconciliation, and complies with IFRS 16 and other accounting mandates. ▪ Accounting Hub: Can bring in transactions and events from many sources, and be used for subledger accounting, insurance, and other finance use cases. ▪ Intelligent OCR: Capabilities for assets, invoices, and other items. ▪ Financial Reporting Center: Built on Hyperion technology, provides basic prebuilt reports and the ability to do more complex analytics. ▪ Cloud Planning: Has extensive planning functionality, including predictive budgeting, profitability, and spend analysis.	▪ Dependency on EPM Cloud: EPM Cloud is used for planning, budgeting, and forecasting, but it relies on a different database than Fusion Cloud ERP, requiring continuous syncing. Its advanced features, such as Cubes for FI consolidation, can be time-consuming to set up and offer too much functionality for midmarket and smaller customers. ▪ Inflexible Setup: Profitability reporting is difficult to configure on the fly for new elements. Often, users must set all metrics in advance. ▪ No Treasury Management: Fusion Cloud ERP has limited Cash Management capabilities and no Treasury Management. ▪ Weak Receivables Management: Also lacks advanced features, such as predictions. ▪ Weak Subscription Billing: Usage billing and subscriptions has limited features and requires significant configuration with a reliance on Fusion Cloud CX. ▪ No Universal Journal: This means no automatic reconciliation, and no single source of the truth coming from one unified table. Oracle must position Accounting Hub to establish these benefits. ▪ Complex Chart of Accounts: Is complex to set up due to segment configuration, managing multiple instances with CoA structures, and fewer best practices and guided configurations than S/4HANA Cloud.

Oracle Fusion Cloud ERP Strengths & Weaknesses | Finance & Spend (2 of 3)

Strengths	Weaknesses
▪ Procurement Cloud: Sold as a separate SKU, but has the same UI, development, and administration tools as Financial Management, making sharing data simple. ▪ Multiple Divisions: Supported by defining multiple axes (country, functional division, etc.), and implemented within the underlying RDBMS. ▪ Trade Networks: Offers support to connect to trade networks, such as GHX, e2Open, Tradeshift, as well as the Oracle Business Network. Suppliers are not charged a transaction fee. ▪ MS Word: Integration is supported for the benefit of importing contracts. ▪ Expense Management: Integrated into Fusion Cloud ERP and includes a mobile app that incorporates GPS tracking for mileage/location-based expenses. Expense images can be captured on mobile devices. Expense Cloud is integrated with invoice processing and General Ledger (for journal entries), so administrators can get an overall report. ▪ Advanced Collections: Module is available with the core Fusion Cloud ERP license. ▪ MS Projects: Integration is supported. ▪ Costs Are Imported: Imported into Project Management from AP, Expense Cloud, and other modules. ▪ Costing and Billing: Supported for Project Management, with a set of controls to ensure the project budget is within bounds. This module also includes cross-charging. ▪ Project Portfolio Management: Tightly included with Financial Management and included with the core Fusion Cloud ERP license. ▪ Supply Chain Planning: Integrated into Project Management, with project-specific material requirements and execution of purchase orders, transfer orders, and work orders; with project and task references.	▪ Integrating Financial Data into EPM Cloud for FC&C is Complex: Requiring Enterprise Data Management Cloud and an ERP adapter. This process involves frequent data imports and exports, making it excessive for midmarket customers. In contrast, SAP's Group Reporting uses a Universal Journal structure, avoiding the need for costly and time-consuming reconstruction. ▪ Oracle Network Lacks Breadth: Lacks the breadth of partners that Ariba offers and has no concept of Business Networks for different industries. ▪ Cumbersome Approval Workflows for Expenses and Procurement: Requires complex rules configurations. ▪ No Outsourced Procurement for Manufacturing: SAP offers Ariba to provide this outsourced procurement. ▪ Billable Projects Lack Depth of Functionality: S/4HANA Cloud can handle internal and external projects, down to payables and receivables for contingent workers. ▪ No Budgetary Control: Lacks control within project costing for work orders and/or billing by material item/service item. ▪ Integration Challenges: Issues with integrating project management with other business functions if those systems are not built on Oracle technologies.

Oracle Fusion Cloud ERP Strengths & Weaknesses | Finance & Spend (3 of 3)

Strengths	Weaknesses
▪ Comprehensive Capabilities: Fusion Cloud ERP provides robust capabilities for manufacturing, supply chain management, warehouse management, and transportation management. These capabilities are enhanced by AI and machine learning features, such as intelligent warehouse operations support. ▪ Complex Corporate Operations: Fusion Cloud ERP offers a robust data model that supports complex organizational structures, facilitating operations like global planning, multi-tiered shipping, and international vendor management. ▪ Sustainability Features: Fusion Cloud ERP includes integrated sustainability tools that centralize key metrics and manage supplier compliance using advanced AI-generated assessments. Users can choose which emissions to track and analyze, providing a comprehensive view of environmental impact. ▪ End-to-End Automation: Fusion Cloud ERP offers comprehensive supply chain automation, ensuring optimized inventory levels, accurate demand forecasting, and smooth order fulfillment. ▪ Real-Time Analytics: Fusion Cloud ERP delivers real-time logistics and transportation analytics, enabling businesses to respond quickly to market changes and improve supply chain efficiency. ▪ Unified Asset Management: Oracle Enterprise Asset Management (eAM) offers a unified global asset archive, enhancing asset tracking, visibility, and control. ▪ Predictive Maintenance: Oracle eAM supports predictive maintenance based on real-time sensor data analytics, minimizing equipment failures and downtime. ▪ Amortization and Depreciation Tool: Project and Portfolio Management (PPM) in Fusion ERP Cloud provides cost accounting for assets by drawing data from the Asset Management database. It integrates with the general ledger to record amortized asset values.	▪ Engineering Change Management: Managing engineering changes between the CPQ system and manufacturing operations can be difficult, leading to inefficiencies in product customization and production planning. ▪ MRP Workloads: Fusion Cloud ERP may struggle with high-volume MRP runs, which can be a challenge for industries with complex production scheduling and costing processes. ▪ Maintaining Asset Registers Is Time-Consuming: This is particularly the case with large asset volumes. The data entry tools, FBDI and ADFdi, have usability and efficiency limitations, complicating the process. ▪ Standalone Depreciation Application in PPM: Also requires manual export or syncing into Oracle Financials as a subledger or direct import into the general ledger via Accounting Hub. ▪ Last-Mile Capabilities: Complex manufacturing organizations may need to extend Fusion Cloud ERP with iPaaS or partner solutions to address specific vertical gaps. ▪ Single-Vendor Usage: Fusion Cloud ERP is often part of a multi-tiered strategy in complex manufacturing environments, rather than a standalone solution. ▪ Roadmap Delays: Customers have confidence in Oracle's roadmap, but are frustrated by the lengthy wait between announcements and actual releases of product-centric enhancements.

Oracle | Pricing

Fusion ERP Cloud Service	Monthly Subscription	Metric
ERP Cloud Service	\$625	Hosted Named User
ERP Self Service Cloud Service	\$20	Hosted Named User
Risk Management Cloud Service	\$180	Hosted Named User
Financial Reporting Compliance Cloud Service	\$175	Hosted Named User
Accounting Hub Cloud Service	\$10	Hosted 1,000 Records
Accounting Hub Analytics	\$4	Hosted 1,000 Records
Document Recognition Cloud Service	\$60	Hosted 1,000 Records
Avalara Global Indirect Tax Cloud Service	\$350	Hosted 1,000 Records
Avalara North America Tax Returns Cloud Service	\$75	Hosted Tax Return
Fusion ERP Analytics	\$450	Hosted named user per month
Fusion ERP Analytics	\$15	Hosted Employee
Additional Test Environment for Fusion Cloud Service	\$75,000 (annual subscription)	Each
Integration Access Cloud Service	\$500,000 (annual subscription)	Each
Additional Storage for Fusion Cloud Service	\$10	Hosted Month
ERP New Features Assessment (Consulting Service)	\$10,000 (one time fee)	Each

Oracle Pricing Practices

- Standard contract for Oracle Cloud Services is 3 years, however, can be offered for 5 years with significant discounts.
- Expect a minimum 55% discount for larger deals.
- Oracle will often offer a slow ramp-up with 10–20% of ACV in the first year, going up steeply in subsequent years.
- “Cloud to Customer” credits for maintenance fees on Oracle OP apps are applied to Fusion licenses for a limited implementation period.
- Oracle offers a baseline service for its cloud products, but most large enterprises will need ACS (Advanced Customer Services), which can add as much as 20% to the cost depending on the level of support.
- Please see [here](#) for the full Fusion Cloud Service Global Price List.

Oracle | Globalization Strategy

Oracle's Globalization

- Oracle claims to offer 27 languages and localization for 50+ countries. Localization includes language, global capabilities, and country-specific features.
- See [here](#) for the list of languages and countries that are supported with the Fusion Cloud Service.
- Depth of country-level reporting varies greatly by country, with some countries having only withholding tax or VAT, and others having general ledger and chart of accounts.
- Translation for Digital Assistants happens through Google Translate.
- Extensions Assets developed by Oracle Consulting and local Oracle teams can be used to extend core functionalities in some countries. For example, electronic payment templates for several banks in Argentina, .xml file generation for eInvoice in Peru, purchase book for Paraguay, collection documents for remittance file transfer templates for Brazil, and so on.
- Partners offer country-specific applications on Oracle Cloud Marketplace. For example, applications for payment process capabilities, treasury applications, eInvoicing documents processing, indirect tax calculation, bank statements loaders, exchange rates loaders, and so on.
- Global capabilities not specific to a country include multiple accounting representations, configurable accounting reports to address regulatory needs, configurable transactions and withholding tax applicability and calculation, configurable tax reporting, advanced fixed assets depreciation, and configurable payment formats.
- Country-specific features include VAT and tax reports in various geographies, withholding tax reports, fiscal document generation for Brazil, audit files, document numbering for Latin America, and virtual account number in Japan.

SAP's Globalization

- SAP's localization support is broader and deeper than Fusion Cloud ERP, enabling businesses to operate efficiently across diverse regions.
- However, this is often masked by Oracle, which provides lists of countries without any details. It is important to ascertain customer requirements and show the depth of out-of-the-box offerings and what can be extended or created with CLT.
- SAP provides pre-delivered robust multi-entity capabilities, ideal for large enterprises with complex global operations.
- The use of standardized processes ensures operational consistency and compliance with global best practices, facilitating easier management of global operations.
- SAP also allows for customization and extensibility to meet specific regional or industry needs. SAP's extensibility tools are more pronounced than Oracle's when it comes to industry-specific requirements.
- Please see [here](#) for the country/region specific functions for S/4HANA Cloud.
- Please see [here](#) for a CMI perspective on SAP's competitive globalization and localization strategies.
